DIAGNOSTIC SYSTEMS
EIS & VEGA

EIS Diagnosis

A modern system used
to provide a body evaluation.

EIS (Electro interstitial scan) is a medical-technological measurement system based on a research of more than 60 years. Nowadays it constitutes an excellent technology in the field of invasive medicine which is used in Europe and America. EIS's diagnostic feature ranks it first among the systems used nowadays in preventive medicine and rehabilitation.

EIS has the potential to provide an overall view of cellular disorders in various organs and organ systems in our body contributing to the more accurate diagnosis of disease causes.

The indexes and the received indications help the doctor evaluate the effectiveness of a treatment or therapy.

EIS as a method

EIS applies a technology that allows the system to scan the whole via electrodes providing a 3D view of scanning results.

EIS displays the following parameters:

Measurements:

Of all organs, glands and tissues for their proper function or dysfunction

Mass-Height –Weight Graphs:

Percentage of fat content, body fluid, bone mass.

Statistical Risks:

Respiratory system, cardiovascular system, gastrointestinal system, immune system, renal function.

Metabolism:

Basic metabolic index (hyperfunction and hypofunction)
Oxidative Stress

Acidosis and alkalosis:

of metabolism, respiratory system, of the interstitial tissue, Ph measurement at the interstitial tissue in every organ.

Statistical neurotransmitter graph:

iAcetylcho, iCatechol, iDopamin, iSerotonin.

Recommended diet:

Forbidden foods, recommended foods and micronutrients (trace elements, metals, vitamins).

How it is applied

The application is absolutely harmless and takes only 3 minutes.

Body measurement is facilitated with the use of six electrodes. Electrodes are used in pairs on the head, the hands and the feet.

Within 3 minutes, the system scans the body via electrodes at the matrix level (interstitial space) providing direct information regarding the cellular state of the body, organs and systems, which are displayed in 3D images.

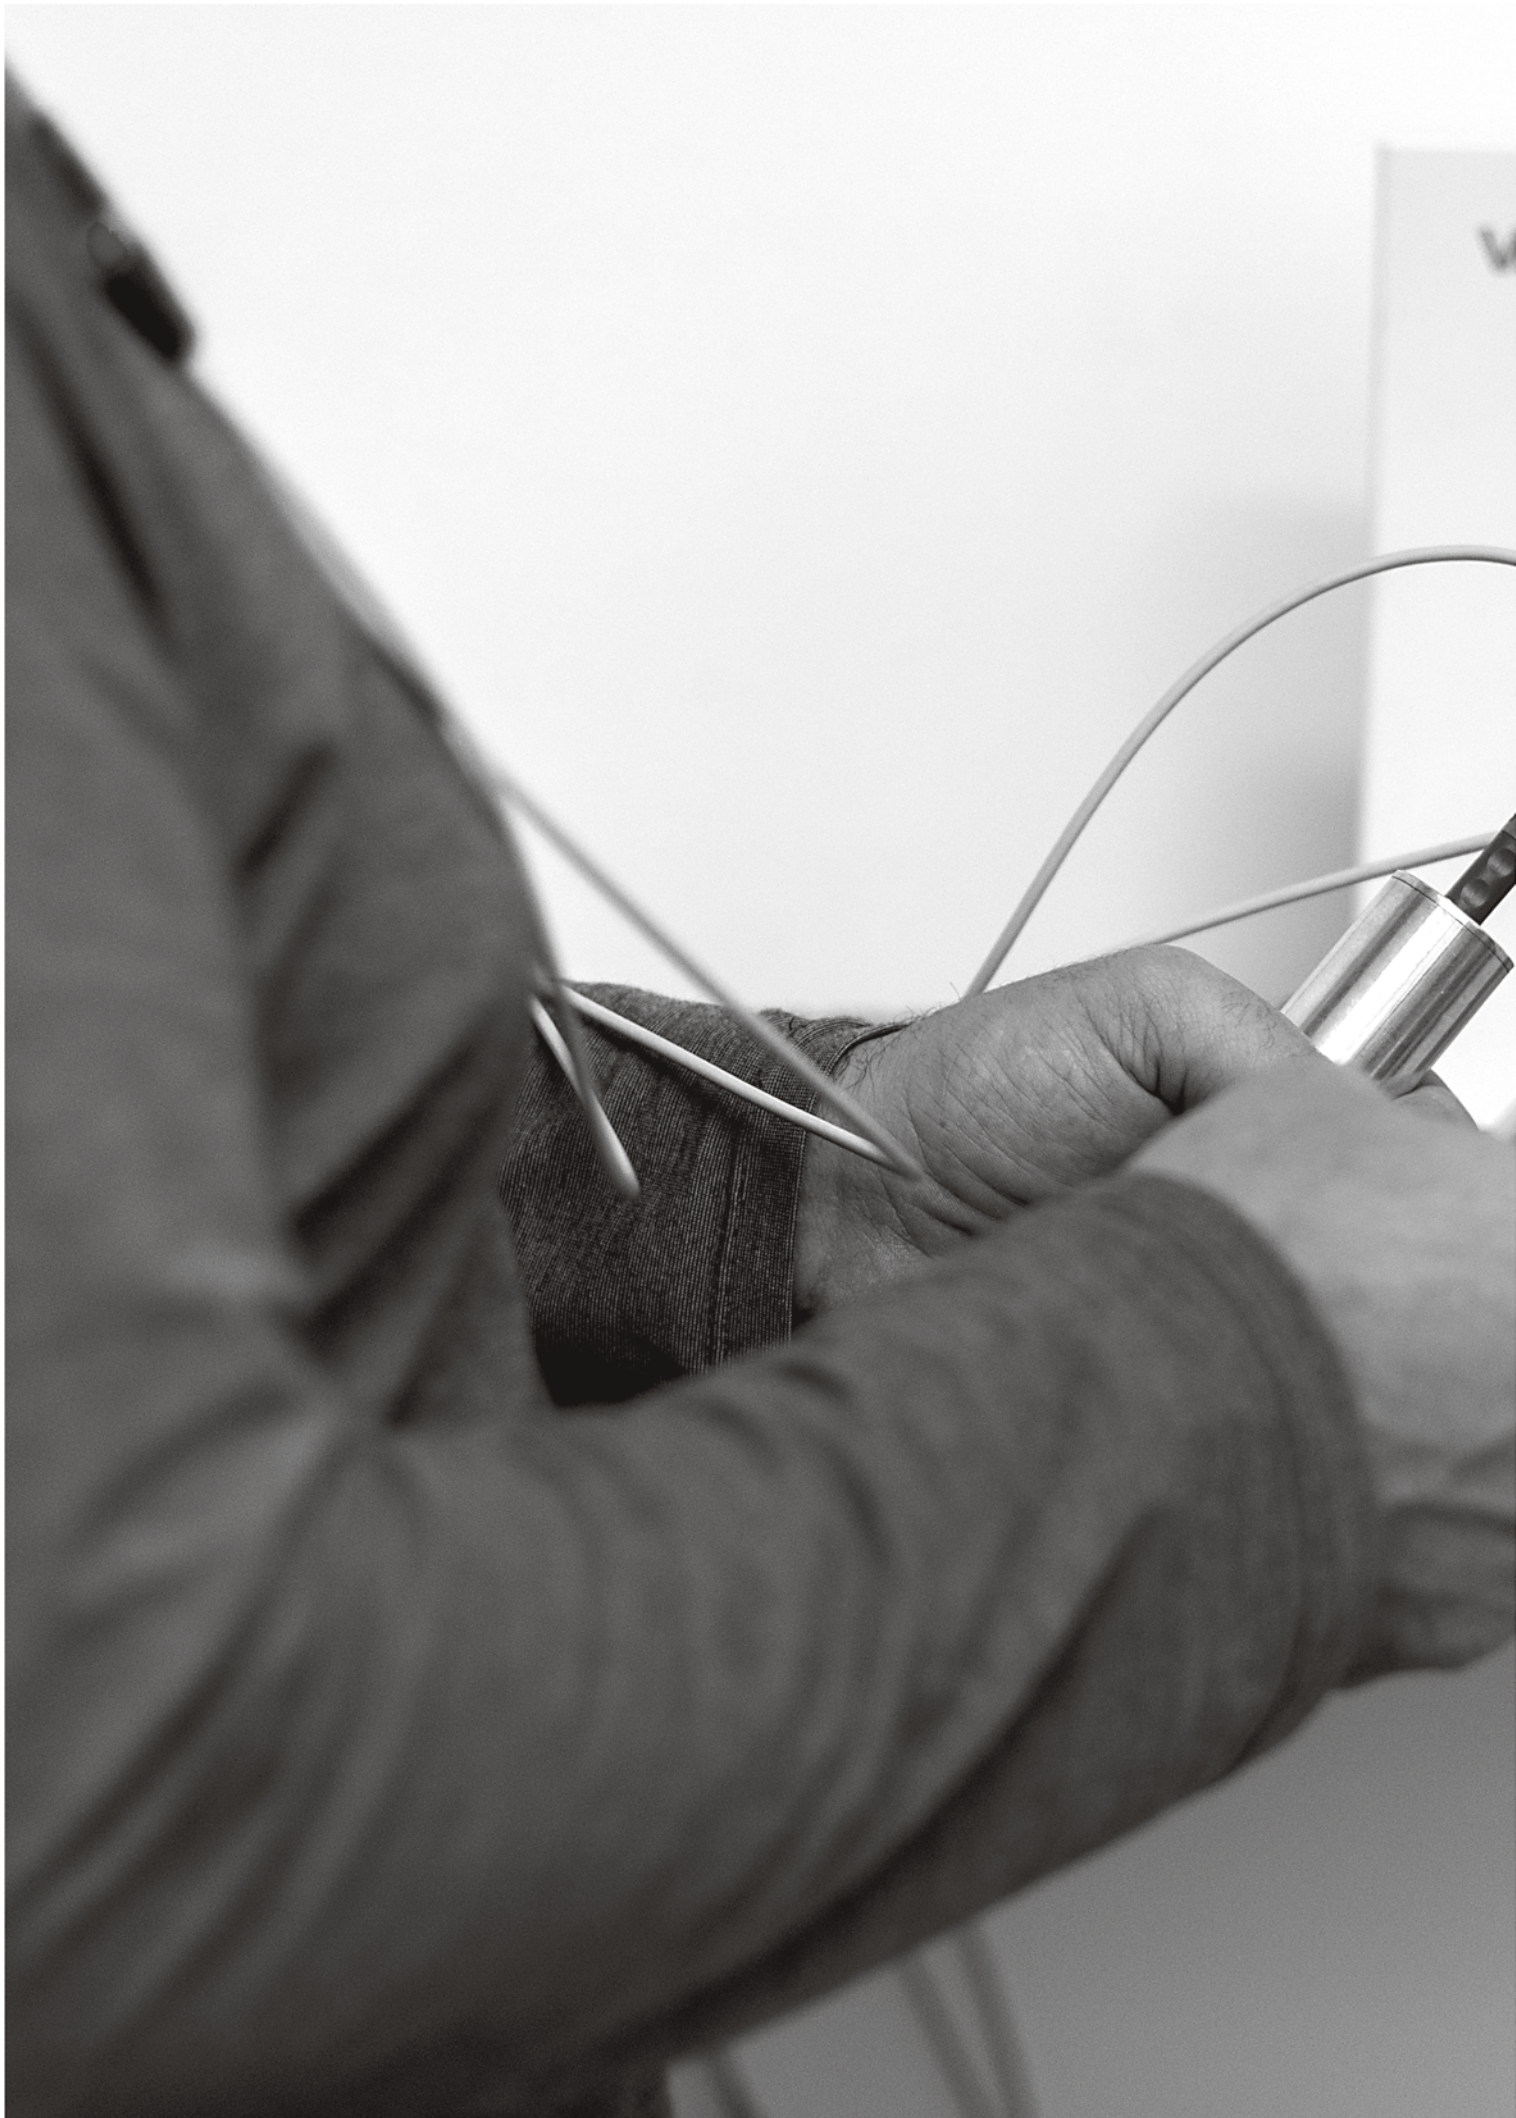

What you should know

A modern system and an ally in the prevention of disease and conditions.

The information that EIS provides to the doctor consist of reliable, true, scientifically documented values with a high repeatability rate.

All these data provide doctors with the necessary information in order to make the most accurate diagnosis and [detect the actual cause of a disease](#). Moreover, this modern system may accurately control the development of the therapeutic course through timely implementation of modifications and changes to the treatment regimen, if necessary, so that the patient may recover fast and steadily.

VEGA Diagnosis

A fast, effective and brief diagnosis

This system provides a smart, fast and accurate way for body monitoring, in the event it is not possible to diagnose a morphological or clinical symptom, while the patient presents disorders.

These disorders are called functional disorders and sometimes they are caused as a result of poor diet, various environmental toxicities, fungi, parasites, stress, pesticides, heavy metals and others

Functional disorders weaken the body's capacity to defense upon the emergence of a number of symptoms (fatigue, insomnia, etc.). VEGACHEK may trace these disorders accurately by scanning the patient from top to toe.

VEGACHECK as a method

A regional electrographic that records functional disorders.

The device has amazing potential regarding the performance of measurements. It literally scans patients from top to toe. It provides the therapist with information regarding the general condition of the patient. It uses graphs to indicate clearly the part of the body, where functional disorders are detected.

The system also prepares information that may be captured for diagnosis and treatments.

This device is actually the result of medical researches, and gives new potential to preventive medicine and the treatment of various diseases.

This device may provide detailed information regarding disorders that couldn't be diagnosed using the typical methods of examination, such as X-rays, ultrasounds, CT or MRI scans, as well as microbiological tests.

This method can diagnose inflammatory fields, latent or chronic conditions, allergies and intolerances, joint blockages, exposure to electromagnetic fields etc.

How it is applied

The application is completely harmless and simple and the results can change your life.

VEGACHECK needs 6 electrodes which are applied in pairs on the head, the hands and the feet. Positive and negative 13 Hertz pulsed loads are directed via these electrodes to 4 different courses.

VEGACHECK captures the electric parameters of additional areas. VEGACHECK measures electrical parameters of 7 segments (derivations), which correspond to specific organs. The results of the measurement of each derivation provide information regarding the energy status, the function of organs and groups of organs and their effects. VEGACHECK actually measures electrical parameters in default areas.

Any deviation from normal marks a disorder.

What you should know

Vegacheck constitutes a new ally in preventing and rehabilitating.

Vegacheck is a modern device, which can provide us with all the necessary indications we need. Of course, this gives us the luxury of time, detecting the conditions and the diseases that couldn't be detected with the use of typical methods long before the emergence of a symptom.

Don't hesitate to report any symptom in the form of disturbance to your doctor. Time in several cases may be valuable and life changing.
